Eddy Ndumia

Software Developer - Nairobi, Kenya

eddyndumia.github.io | ndumiaeddy8@gmail.com | github.com/eddyndumia | linkedin.com/in/eddyndumia

SUMMARY

Final-year Mathematics and Computer Science student at JKUAT (graduating December 2026). I build and run production web and mobile systems for businesses in Kenya: websites, internal business systems, payment records and mobile apps. Freelance since 2020, with data engineering work on AWS. Most interested in software for payments, finance and data.

EXPERIENCE

Head of Technology and Digital Products - Famyard Enterprises

2025 - Present | Land sales company, Nyeri and Laikipia

- Rebuilt famyard.co.ke in Next.js and moved it off WordPress, with every old URL redirected.
- Built the internal system the staff run the business on: plots and estates, enquiries and a sales pipeline, a payments ledger with numbered receipts and reversals instead of edits, the company email inbox, and role and department access with two-factor sign-in and encrypted backups.
- Built the engine for a one-plot tokenized land pilot planned for the CMA regulatory sandbox: investor checks, holder register, Hedera Token Service issuance, escrow and reconciliation. Runs on Hedera testnet.

Developer - Apex AutoMobiles

2026 - Present | Car import business, Nairobi

- Built the public website (about 1,700 cars, static pages on Cloudflare) and Apex Manager, the dealer system for stock, photos, preparation tasks and costs, with one-click publishing through GitHub Actions.
- Migrated 1,660 cars and 31,000 photos from the old WooCommerce site into the new system.

Developer (contract) - GBL Capital

2026 | Futures signals service

- Built the Flutter customer and desk apps and a TypeScript backend (Fastify, Postgres, public and admin APIs, worker) with Stripe billing and Firebase push alerts; shipped ten releases to 2.0.0 with about 110 automated tests.

Founder and Developer - Chukua

2026 - Present | Own product

- Android app for giving things away to people nearby, live in Nairobi since October 2026 (v1.3.5). Flutter, Supabase and PostGIS, with the rules enforced in SQL and Row-Level Security, push alerts and in-app updates.

Freelance Web and Full-Stack Developer

2020 - Present | Kenya

- Websites and full-stack builds for small businesses, in WordPress or code.

EDUCATION

B.Sc. Mathematics and Computer Science - JKUAT

2020 - 2026 (graduating December 2026)

ALX / Holberton Software Engineering Programme

2023 | C, algorithms, Linux

OTHER PROJECTS

Sales ETL Pipeline - Messy sales export cleaned, tested and loaded into a constrained SQLite warehouse; six data-quality checks gate every run in CI.

Sales Demand Forecasting - Seasonal-naive, SARIMA and XGBoost compared on a 90-day holdout.

Voice Forge - Desktop audio app in Python; GPU jobs run on Kaggle through its API. In development.
